Accelerating Innovation for Miro Users with Generative AI Models Built on AWS

[Miro](#) aims to empower teams to create the next big thing. The software company, which provides a visual workspace for innovation, supports over 60 million users worldwide and is a critical part of the modern enterprise application stack.

Always striving to be on the cutting edge, Miro began to explore the potential of generative artificial intelligence (AI) to support its users. The result was Miro Assist, an AI-powered thought partner that supercharges each step of the innovation journey.

Miro Assist consists of a diverse set of AI features built on Amazon Web Services (AWS). Using services like [Amazon Elastic Kubernetes Service](#) (Amazon EKS), a managed service for running Kubernetes on AWS, Miro can quickly deploy and scale its AI features, relying on expert support and flexible security provisioning from AWS.

Opportunity | Using AWS Services as a Blueprint for Deploying Generative AI Models for Miro

Miro helps distributed teams of all sizes collaborate and use the solution to lead engaging workshops and meetings, design products, brainstorm ideas, and more. “Miro is redefining how teams that bring new products and services to market can get projects from idea to launch, helping them unlock the huge potential of generative AI,” says Ayala Ohyon, head of data science at Miro.

Because of its successful history on AWS, Miro pursued using Amazon EKS for a consistent deployment process for generative AI models. Miro developed an architecture to serve as a blueprint for setting up new AI microservices. “The collaboration we have with AWS representatives gives us confidence that we’re using the technology in the optimal way,” says Ohyon.

Solution | Increasing Scalability Using Amazon EKS and Reducing Time to Market to Weeks

With millions of users, Miro needs to handle variable traffic volume. Using Amazon EKS, Miro can scale as needed to reduce overprovisioning while maintaining low latency, low error rates, and a stable solution. Using the blueprint built on AWS, Miro can set up a generative AI microservice in production in weeks instead of months.

With AWS support, Miro is transforming how teams use AI to bring break-through products to market. Using Miro Assist, users can rapidly expand their thinking, get instant insights for better decision-making, and reduce the time spent on daily tasks. For example, Miro Assist features built on AWS help users quickly uncover valuable insights from research, team retrospectives, or brainstorm sessions. Processes that used to take days now happen in seconds. “We’re breaking new ground with our AI solutions, but this can’t come at the expense of user experience,” says Ohyon. “It’s very helpful to have direct contact with people at AWS who are fluent in the resources and can give advice and assurance that we’re maximizing the full potential of the current technology.”

Using AWS, data is encrypted at rest and in transit, and access to data is controlled through [AWS Identity and Access Management](#) (AWS IAM), which securely manages identities and access to AWS services and resources.

“Security remains a key consideration for customers on their AI journey,” says Ohyon. “It’s critical that AWS has robust security provision that can flex with our specific needs.”

Outcome | Investing in Innovation Using a Standard Approach Built on AWS

Miro plans to continue investing in its AI features built on AWS. “By adopting a standardized approach built on AWS, we are empowered to rapidly create cutting-edge AI models and help Miro users benefit from the latest AI developments.”

About Miro

Miro is a visual workspace for innovation that helps distributed teams of any size build the new. The company's infinite canvas helps teams lead engaging workshops and meetings, design products, brainstorm ideas,

and more.

AWS Services Used

Amazon EKS

Amazon Elastic Kubernetes Service (Amazon EKS) is a managed Kubernetes service to run Kubernetes in the AWS cloud and on-premises data centers.

[Learn more »](#)

AWS IAM

With AWS Identity and Access Management (IAM), you can specify who or what can access services and resources in AWS, centrally manage fine-grained permissions, and analyze access to refine permissions across AWS.
