

Condor Develops Generative AI Prototype for IT Support in Weeks by Using Amazon Bedrock

The prototype built with the AWS partner [MadeinWeb](#) aimed to provide IT and Helpdesk support with [Amazon Bedrock](#), the AWS managed service for generative AI.

can find answers to their questions based on the company's IT ticket history. Charla also helps direct integration into company tools, such as the calling tool, as it is a service built with APIs.

The prototype built on Amazon Bedrock with the Charla platform provided yet another way to complement the service provided by Condor employees, focused on improving SLAs and optimizing team tasks.

Building a Solution to Evolve Complex Use Cases

The solution proposed by MadeinWeb, in partnership with AWS, was built based on a robust architecture, starting with the creation of a secure repository in [Amazon Simple Storage Service](#) (Amazon S3). This repository provided fast, secure, and cost-effective access to thousands of documents related to Condor calls, knowledge bases, and technical standards.

Native integration with Amazon S3 objects made it easy to implement the [Amazon OpenSearch Service](#) to create a fully vectorized database, allowing a more efficient search and advanced internal call analysis while also maintaining the versatility needed to handle various document formats.

“After extracting this data, we used the semantic capacity of a foundational model to understand the calls and structure the solution to the user's demands, which allowed for a very strong assertiveness in complex problems,” explains the director of Cloud, Data & AI at MadeinWeb, Vinicius Machado. Initially, customized models were implemented using [Amazon SageMaker](#), providing substantial computational power. Subsequently, the switchover to Amazon Bedrock brought versatility to the Charla platform in choosing foundational models, facilitating development and experimentation through APIs.

In Machado's point of view, the choice of Anthropic's Claude-2 foundational model was crucial. “Claude-2 has a great advantage because it brings legal concepts and responsibility in its training, facilitating control over hallucinations and meeting the concepts of fairness AI,” he explains. “Hundreds of calls were analyzed and technical documents processed to ensure the accuracy of Charla's answers.”

The architecture was then built using key AWS services, including the [Amazon API Gateway](#) and the [AWS Lambda](#) function. Pereira explains that the prototype of the solution has been completed and that in 2024 the focus should be expanded to more AI tools from AWS, such as demand forecasting. “With a solution that generates assertive responses, we saw the real potential of AWS AI tools up close,” he reveals.

The other AI front, in its final phase by Condor and MadeinWeb, is the use of demand forecasting on AWS to facilitate Condor's S&OP process. It was fed with historical sales data from the past two years. The results already indicate an accuracy of over 90 percent between what is expected with machine learning and what is achieved in several SKUs.

“We believe that the use of machine learning greatly complements the demand analyses carried out internally, based on the team's human knowledge. In 2024, we hope to expand the use of AI thinking about all of the two thousand items that we sell today”, explains Pereira.

About Condor

Founded in 1929, Condor is a Brazilian company that operates in the oral care, beauty, cleaning and painting products sector, and is a reference in the segment of utensils and accessories for personal and home care. With more than 1,500 products in its portfolio, Condor operates in over 100,000 points of sale in Brazil and exports to more than thirty countries.

AWS Services

Amazon Bedrock

Amazon Bedrock is a fully managed service that offers several high-performance foundation model (FMs) options from leading AI companies through a single API, plus a broad set of features needed to create generative AI applications with security, privacy, and responsible AI.

[Learn more »](#)

Amazon SageMaker

Amazon SageMaker is a fully managed service that brings together a broad set of tools to provide high-performance, low-cost machine learning (ML) for any use case.

[Learn more »](#)

AWS Lambda

AWS Lambda is a computing service that executes your code in response to events and automatically manages computing resources, making it the fastest way to transform an idea into modern applications with serverless technology.

[Learn more »](#)

Amazon API Gateway

Amazon API Gateway is a managed service that allows developers to easily create, publish, maintain, monitor, and secure APIs at any scale. APIs act as the “gateway” for apps to access data, business logic, or functionality from your backend services.
