Ubidy Reduces CV Review Time by 95% and Improves Accuracy with AI Pipeline on Amazon Bedrock

Ubidy implements the latest large language models on Amazon Bedrock for on-demand processing of CV data, saving corporate recruiters time and managing internal costs.

Scales AI pipeline to fit job market change

Bias mitigation

Reduces biases and provides explainable outputs

Overview

[Ubidity](#) is a global recruitment marketplace that connects enterprises with niche recruiting agencies to quickly fill complex roles. To stay on the cutting edge of LLM technologies, the company chose to migrate from OpenAI to AWS and utilize generative AI on AWS services.

By hosting its AI pipeline on [Amazon Bedrock](#), Ubidity runs its models at a fraction of the cost of competing cloud and open-source platforms, while complying with data privacy and residency requirements.

Opportunity | Building a Global Recruitment Agency Marketplace

[Ubidity](#) was born in 2016 as an online, business-to-business (B2B) recruitment marketplace connecting enterprises with specialist agencies across the globe. Using proprietary artificial intelligence (AI) pipelines, Ubidity matches global candidates with highly specific job opportunities at a fraction of the cost and time required to fill such roles via traditional large-scale agencies.

Despite the advanced AI-driven tools at Ubidity, in 2023, clients began requesting more tailored candidates for niche positions. As a customer-centric organization, Ubidity sought to refine its AI pipelines to ensure the curricula vitae (CVs) submitted to clients matched their job descriptions as closely as possible.

That same year saw the rise in a large number of new use cases for large language models (LLMs). Like other software pioneers, Ubidity is acutely aware of the [AI alignment problem](#), in which AI often delivers biased search results not aligned with operators' values. The company's leaders viewed the convergence of LLMs and the desire to fulfill client wishes as a unique opportunity to improve digital recruiting.

Solution | Ensuring Performance and Accuracy with Cost-Effective Model Hosting

Ubidy was already in the midst of migrating its infrastructure from another cloud provider to Amazon Web Services (AWS). Evan Shellshear, who had recently joined Ubidy as managing director and chief executive officer, had long been an AWS customer and advocated for the platform's range of tooling in fields including generative artificial intelligence (generative AI).

"If you look at all the releases and activities underway in the generative AI space, it's clear that the breadth and depth of AWS offerings in a given period of time is consistently greater than any competitor," Shellshear says. Ubidy compared the accuracy, performance, and cost of running LLMs like Falcon and Llama 2 on AWS versus other public clouds and open-source platforms.

Data residency and privacy were also important considerations. The nature of Ubidy's application, which uses AI to determine the suitability of job candidates, is classified as high-risk under the European Union's AI Act. Ubidy thus had to rule out certain open-source AI platforms because they didn't meet data privacy requirements.

"We found that we couldn't run our models as quickly, securely, or cost-effectively on any other platforms as we could on AWS," Shellshear recalls. Ubidy began the migration of its entire infrastructure to AWS, a move that would facilitate integration between core services such as [Amazon Elastic Compute Cloud](#) (Amazon EC2) compute instances—which it had been using to host and manually deploy its Python machine learning (ML) pipeline—and advanced ML services.

Next, Ubidy began testing [Amazon SageMaker](#) to run its AI models. It quickly determined, however, that Amazon SageMaker wasn't the ideal fit for its use case. An AWS solutions architect suggested Ubidy try [Amazon Bedrock](#). Unlike Amazon SageMaker, which is a time-based service that runs 24/7, Amazon Bedrock can be deployed for processing and stopped on demand, dramatically reducing costs and architecture complexity.

"The Llama 2 70B model on Amazon Bedrock emerged as the most cost-effective option based on our evaluation criteria, providing competitive pricing without compromising performance or accuracy," says Kah Wee Oh, chief technology and product officer at Ubidy.

The company has automated unit tests that include a fixed set of CVs and job descriptions for which it knows what the matching results should be. Each time it rolls out new models, Ubidy unit-tests against the results to assess output accuracy. After successfully implementing Amazon Bedrock, Ubidy introduced its new pipeline for two enterprise clients: McConnell Dowell and Europ Assistance.

Outcome | Reducing CV Evaluation Time by 95%

Initial results show that Ubidy's application has achieved a 95 percent reduction in the time required to evaluate CVs. Previously, after submitting job descriptions to Ubidy, corporate recruiting clients would receive dozens of candidates with varying degrees of fit; now, they only receive the top-ranked CVs based on the quality of fit for the job. This has significant long-term impact, with Ubidy's clients filling niche jobs faster while requiring fewer recruiters on staff.

In addition, Ubidy reports that its models are successfully picking up all the requirements in each job description, returning each request in just 10 seconds. "We, along with our clients, are always looking for how quickly the model can respond and how fast we can process a job description. This is where AWS really shines," Shellshear says. With data centers and AWS regions around the globe, Ubidy easily meets data residency and latency requirements.

The company also appreciates the on-demand aspect of running its pipeline on Amazon Bedrock, with the ability to scale up and down according to fluctuations in the job market. This ensures predictable, controlled costs as the company expands. Ubidy is committed to remaining on the cutting edge of the evolving AI landscape, and continually introduces new LLMs as they become available. The ability to run multiple LLMs on Amazon Bedrock is likewise invaluable.

"AWS continually works to drive costs down in a relentless pursuit of doing more, and better," Shellshear says. "Our AWS account managers are always finding ways to help us use the cloud more efficiently and have provided enormous support on our journey." For example, Ubidy and AWS co-hosted an event in 2024 called "The Symbiosis between Maths and AI," aimed at helping fellow data scientists problem-solve.

Ubidy also has on its roadmap with AWS a plan to develop a feature that will help companies find issues in job descriptions before beginning the recruiting process. Shellshear elaborates, "Some clients have recognized through using our tool that problems exist in their job descriptions—issues that would prevent them finding the right candidate. A revolution is underway in talent acquisition, and we're well positioned to get ahead of the curve."

About Ubidy

Ubidy is a global talent acquisition platform specializing in executive search and recruitment services. The software specialist focuses on connecting businesses with top-tier talent across various industries and regions via boutique, niche, and specialized recruitment agencies around the world.

AWS Services Used

Amazon Bedrock

Amazon Bedrock is a fully managed service that offers a choice of high-performing foundation models (FMs) from leading AI companies like AI21 Labs, Anthropic, Cohere, Meta, Mistral AI, Stability AI, and Amazon through a single API, along with a broad set of capabilities you need to build generative AI applications with security, privacy, and responsible AI.
