About Totality Corp

Founded in 2017, Totality Corp is a media technology company that's committed to being at the forefront of innovation a digital platform that harnesses AI power to generate hyper-realistic images for anything from social media profiles to gaming avatars and virtual reality experiences. Its vision is to "empower everyone on this planet with the opportunity to create anything, do anything, by being themselves." Its products include a video game, an interactive video mobile app, an NFT gaming ecosystem, and most recently, the company developed a

Technology has seen exponential growth and has transformed the world in ways we can't even imagine in the past. For Totality Corp

(<https://www.totalitycorp.com/>) founder Anshul

Rustaggi, this wave of technology presents many new and exciting opportunities. "At Totality Corp, we're always looking at different areas of technology that are evolving and innovating," he says. "We build products that serve consumers as we can see the direct impact of our technologies in their everyday lives," says Rustaggi.

From gaming to interactive video capabilities, the company is exploring the world of NFTs and generative AI (Gen AI) technology. It recently launched Never, an application that lets people generate "impossible" versions of themselves that use Gen AI capabilities to create hyperrealistic

images. With that, Totality Corp embarked on a journey of innovation with Google Cloud, leveraging [Vertex AI](https://cloud.google.com/vertex-ai) for its AI and machine learning capabilities, and [Cloud GPUs](https://cloud.google.com/gpu) to manage its AI workloads.

Building on an existing stack to innovate further

Totality Corp's journey with Google Cloud actually began in 2021. Currently, the company uses [Cloud CDN](https://cloud.google.com/cdn) for its video CDN needs, [Google Kubernetes Engine](https://cloud.google.com/gke) for managed Kubernetes cluster deployments, and [Cloud Storage](https://cloud.google.com/storage) to store its repository of images and other VMs. The team also uses [Cloud SQL](https://cloud.google.com/sql) to manage its databases.

"When we started using Cloud GPUs for our Gen AI applications recently, we found a valuable partnership with the Google Cloud team. Their expertise in the field has really helped us work through our challenges in this new and rapidly changing environment," says Rustaggi.

Working with a team that's invested in the business

Without discounting the capabilities of Google Cloud products, both Rustaggi and Govind Singh, Chief Technology Officer at Totality Corp, agree that it's the relationship they have built with the Google Cloud team that's been a significant value-add to the business.

"Google Cloud has been extremely helpful, not only in supporting our migration but also in providing solutions to some of our larger business problems," says Rustaggi. "Being at the forefront of technology, we need quite a bit of help, and having a team of experts that understand their products and how they can be used to meet our business needs is truly valuable."

For example, with Never, the team needed a viable and cost-efficient way to expand its consumer base to include the US as well as India. "We created an architecture in the US servers that needed to be duplicated here in India. So we told the Google Cloud team the issues we had and our goal, and they were able to give us options, as well as the costs and implications of each solution. This is rare within the industry," explains Singh.

"The team at
Google Cloud
has been
extremely
helpful, not only
in supporting

Founder, Totality Corp

Improving productivity and deployment times for quicker innovation

The team leverages Cloud GPU for training purposes and to support the deployment of its products for its Never application. "Our application is in the field of personalized media. We tell customers that they can create and personalize any form of media they want, such as enhancing an existing photo, having its

background changed, or users can choose to create a completely new photograph from scratch," explains Rustaggi.

With such a high level of personalization, Totality Corp faced issues in managing the data load for every model, as they were customized to each user. "Every model was about two and a half gigabytes, which is a lot of data to store. This is where the Google Cloud team stepped in and gave us a solution with optimized Cloud GPUs that had easily saved us about five to 10x of our costs," says Singh.

As a whole, Totality Corp's time-to-deploy has come down from an average of seven hours per setup, to just five hours for every new project since moving to Google Cloud. This includes time to research the platform offerings.

"We've also noticed that the built-in observability options in every product have been useful during service onboarding and for debugging, alongside the rich documentation that has made the journey moving our workload easy and quick," says Singh.

Building a responsible AI environment with Google Cloud

As a company launching Gen AI-driven products, responsible AI is always top of mind. "Our main concerns in adopting Gen AI are to maintain ethical and fair AI practices, data security, and ensure its alignment with our business goals. We're addressing them by prioritizing AI literacy, data management skills, ethics and bias mitigation, interdisciplinary

collaboration, and prompt engineering," says Rustaggi.

Every user at Never is required to also submit a selfie, and agree to the terms that every new product they create is for personal use. "AI is such a powerful and new technology and it can be used for different purposes like deep fakes, which is why we really prioritize the security of our customers' data," adds Rustaggi.

With that, he believes that working with Google Cloud has been a well-calculated decision, with its [Responsible AI](https://cloud.google.com/responsible-ai) (<https://cloud.google.com/responsible-ai>) commitment. While Totality Corp doesn't currently use any additional security features offered by Google Cloud, there are plans to implement them in the near future.

In fact, Rustaggi and Singh are already working towards migrating all of its cloud solutions to Google Cloud. "Alongside the strong support we receive from the team at Google Cloud, having everything on the same platform would make it easier for us to manage as we continue to grow and scale as a company," says Singh.
