[About Freightos](#)

After building its logistics platform on Google Cloud, Freightos.com uses microservices for flexibility, a faster cycle, and improved workflow across development teams.

About Freightos

Freightos.com is digitizing international logistics for freight companies and retailers via its online marketplace and SaaS software, making global shipping faster, more cost-effective, and smoother.

Industries: Technology

Location: Hong Kong

[SQL](#) (<https://cloud.google.com/sql/>), [Compute](#)

Google Cloud results

- Helps development teams to work more autonomously, speeding up release cycles
- Powers big data analysis with BigQuery, enabling functionality such as global container freight indexes
- Supports teams in collaborating using Google Cloud and Google Workspace

The global logistics market is expected to grow to \$12.6 billion by 2023, and digital up new opportunities for reducing

About DoiT International

DoiT International is a leading global cloud consulting company and strategic partner of Google Cloud and Amazon Web Services. It tackles complex problems of scale for its customers, using expertise in resolving problems, machine learning, algorithms, complexity analysis, and system design.

redefining business models. Freightos (<https://www.freightos.com/>), a Freightos Company, aims to be at the center of making global trade frictionless marketplace for the trillion-dollar shipping industry. Freightos.com marketplace helping importers & exporters logistics spend and save time with comparison, booking, and managing ocean, and land shipments from providers. The result is international as smooth as booking a flight online.

Founded in 2012, the company has offices across the United States, Europe, Middle East and works with major Marks and Spencer (<https://www.marksandspencer.com/>).

“Our goal at Freightos.com is to help people work together across the globe. To do that, we wanted to work with the best hosting and

mapping
provider. Along
with Google
Maps Platform
and Google
Workspace,
Google Cloud is
at the heart of
what we do at
Freightos.com.”

—Michi Kossowsky, CTO,
Freightos.com

“Our marketplace offers an unrivalled breadth of choice, in terms of the routes and options we cover,” explains Michi Kossowsky, CTO at Freightos.com.

“Instead of going through a freight forwarder, retailers and distributors can easily search for spot shipping quotes and compare them by price, estimated transit time, and so on. They can then track their shipments once they are en route.” As well as getting the best price, the user can also enjoy a more frictionless experience.

Because the Freightos.com platform relies on processing large volumes of data very quickly, Freightos.com chose to build it on the cloud. Google Cloud (<https://cloud.google.com/>) stood out, as it offered a unique solution to its hosting needs for in-memory processing. Once the platform was up and

running, Freightos.com wanted to speed up its testing and delivery cycle, as well as create a more efficient workflow for its international teams of developers. Moving from a monolithic infrastructure to microservices on [Google Kubernetes Engine](#) (/kubernetes-engine) (GKE) was the answer.

“Our goal at Freightos.com is to help people work together across the globe,” says Michi. “To do that, we wanted to work with the best hosting and mapping provider. Along with [Google Maps Platform](#) (/maps-platform) and [Google Workspace](#) (https://workspace.google.com/), Google Cloud is at the heart of what we do at Freightos.com.”

Building an infrastructure to support big data processing

While many companies now work with large datasets, Freightos.com’s challenge was exceptional. “We receive hundreds of thousands of searches a day, and to generate quotes, we search through tens of millions of data points supplied by more than 75 freight providers,” explains Michi. “So to run the graph-search algorithms, our app needs access to high-speed in-memory data.”

Freightos.com found a solution to this challenge by using [App Engine](#) (/appengine) flexible environments, providing access to 200 GB of routing data. However, it realized that breaking up its monolithic services would enable its development teams to work it a much more agile way.

“BigQuery is the bread and butter of our analytics, enabling us to query tremendous amounts of data very quickly, with little maintenance. It has helped us to do things such as put together a global container freight index. Thanks to BigQuery, we can update the index every day.”

—*Michi Kossowsky, CTO,
Freightos.com*

To do that, Freightos.com worked with implementation partner [DoiT International](https://www.doit-intl.com/) (<https://www.doit-intl.com/>) to migrate to GKE. “DoiT

International has been providing Freightos.com with consulting services and support from the beginning,” explains Tony Braun, Cloud and Geolocation Sales Manager at DoiT International. “We also support Freightos.com in using Google Maps Platform, as its software depends on Maps geo-location, routing, and place information APIs.”

Freightos.com took a multiphased approach, re-architecting its infrastructure before making the switch. Freightos.com now uses GKE with Compute Engine (/compute), Pub/Sub (/pubsub), and Dataflow (/dataflow) for its application pipeline. Cloud SQL (/sql) and Datastore (/datastore) provide operational storage, while BigQuery (/bigquery) and Looker Studio (<https://marketingplatform.google.com/about/data-studio/>) offer data warehousing and data visualization.

“BigQuery is the bread and butter of our analytics, enabling us to query tremendous amounts of data very quickly, with little maintenance,” says Michi. “It has helped us to do things such as put together a global container freight index. Thanks to BigQuery, we can update the index every day.”

Freightos.com also offers its platform software on a SaaS basis, so freight forwarders can quickly and easily provide shipping rate quotes to direct customers. As part of this offering, Freightos.com uses the Apigee API Management Platform (/apigee) with Apigee developer portal (/apigee) to export APIs so they can be accessed by freight forwarders. “Apigee makes it easy to export and expose our

APIs, encouraging adoption amongst our customers,” says Michi.

Coordinating teams across borders

Since switching to microservices using GKE, Freightos.com is finding it easier to coordinate its development teams and increase efficiency. That’s important, because it has teams based in Barcelona, Jerusalem, and Ramallah.

“The ability to work together and collaborate closely has been transformative,” says Michi. “Working with our other development teams on projects is one of my favourite things about working at Freightos.com. It is helping to change perceptions about what is possible, in terms of working together across geopolitical divides.”

Google Workspace is also supporting Freightos.com’s teams in collaborating, whether that be editing in real time using [Docs](https://workspace.google.com/products/docs/) (<https://workspace.google.com/products/docs/>), or holding a meeting using [Google Meet](https://workspace.google.com/products/meet/) (<https://workspace.google.com/products/meet/>). “It’s central to the way we work,” says Michi. “Almost everything that happens in the company is facilitated by Google tools.”

“Thanks to
Google
Kubernetes
Engine, it’s
easier to scale
up or down, and
because the
testing and
production
environments
are the same, it’s
much easier to
deploy. Teams
can work more
autonomously,
and our platform
is more stable
as a result.”

—*Michi Kossowsky, CTO,
Freightos.com*

**Working towards a more digitized
freight industry**

Previously, Freightos.com's development team had to follow a number of steps to test code before moving into production, which was time consuming. Now, it has a CI/CD pipeline that has automated that process, as well as enabled teams to work independently on individual services. "Thanks to Google Kubernetes Engine, it's easier to scale up or down, and because the testing and production environments are the same, it's much easier to deploy," says Michi. "Teams can work more autonomously, and our platform is more stable as a result."

Michi also appreciates the operations tools (/products/operations) that Google Cloud offers for monitoring, such as Cloud Monitoring (/monitoring). "DoiT International has been really great in terms of helping us see where we can be more efficient," says Michi. "We use its reOptimize (<https://www.reoptimize.io/#product>) platform for monthly cost predictions and to continuously optimize our Google Cloud activity."

Freightos.com is now looking into possible applications for Google Cloud machine learning tools. "Some interesting applications for us could include using machine learning to automatically identify and match commodities to HS (product classification) codes, creating a predictive transit time estimator based on past carrier performance, and analyzing seasonal and weather factors," says Michi.

It hopes that it can act as a trailblazer in helping people to work with one another. "Our goal is not

only to be the number one freight marketplace, but to act as a real hub, driving standardization across the industry and helping connect all the different parties,” says Michi. “The Google services we use are fundamental to that vision.”
