Founded in 2015 and headquartered in India, [GreedyGame](https://greedygame.com/index.php) (<https://greedygame.com/index.php>) provides native advertising for mobile games. "The current way that gaming and online content generally is monetised is very intrusive and almost kills user engagement, leading to very low retention rates," explains Arink Verma, Co-Founder and Chief Technology Officer, GreedyGame. "So when we founded GreedyGame, we opted to use content-driven, in-game advertising rather than banner or interstitial advertising. For example, in a mobile football game, the publisher can monetise the players' jerseys, the ball, and the stadium in much

the same way as teams and other commercial participants do in real life.”

This model is delivering considerable success for the fledgling business. GreedyGame has a team of 30 employees, 20 of whom contribute to product development and the remainder to sales and business development. Live on more than 100 games, GreedyGame manages about 3 million ad requests daily.

Launching on the cloud proved to be a no-brainer for the business. “The biggest challenge of any global advertising network is availability and distribution, so running our own physical servers is not an option,” Verma says. “Furthermore, as we started out with just two team members, we wanted to focus on innovation rather than activities such as managing infrastructure.”

“Our evaluation
found that
Google Cloud
could provide
services that
related directly
to our core
business and we

saw an
opportunity to
outsource those
activities that
could distract
from our
purpose.”

*—Arink Verma, Co-
Founder and Chief
Technology Officer,
GreedyGame*

GreedyGame launched onto a public cloud service with a minimal viable product that Verma describes as “a few static files on a content delivery network.” However, as the business matured, its advertising targeting and content delivery needs became more sophisticated. Verma began reviewing cloud platforms more aligned to these requirements.

“Our evaluation found that Google Cloud (<https://cloud.google.com/>) could provide services that related directly to our core business and we saw an opportunity to outsource those activities that could distract from our purpose,” he says.

Google Cloud also supported a microservices architecture that would enable GreedyGame to meet game publishers’ strict performance and availability requirements. Furthermore, the company’s review determined Google Cloud could support demand

peaks—sparked typically by the international cricket series or similar sporting events—that could increase traffic to up to 10 times normal levels without compromising the delivery of advertising.

GreedyGame elected to move to Google Cloud and its internal team completed its initial migration to the cloud platform. However, GreedyGame realised it needed external assistance to access the full range of Google Cloud products that could deliver value to its business. GreedyGame then engaged Indian-headquartered business process specialist Searce (<https://www.searce.com/>) to optimise its architecture. Searce encouraged GreedyGame to use Google Cloud products that would enable the mobile game advertising business to run a highly available, responsive, and targeted advertising network.

These products, including Google BigQuery (<https://cloud.google.com/bigquery/>) as a data analytics warehouse, Google Cloud Vision API (<https://cloud.google.com/vision/>), an image content analysis tool, and Google Compute Engine (<https://cloud.google.com/compute/>), “only came to light through the partner,” Verma acknowledges.

“Google Cloud
has enabled us
to emerge as a
lean, efficient

mobile game
advertising
provider with an
advertising fill
rate of 70%,
which is above
the industry
standard of 50%,
due primarily to
our lack of
downtime.”

*—Arink Verma, Co-
Founder and Chief
Technology Officer,
GreedyGame*

GreedyGame is now using Google BigQuery to store data and make it accessible to team members as needed. Google Compute Engine provides infrastructure resources as a service while Google Cloud Vision API enables GreedyGame to classify images and filter out any that may be undesirable.

Searce also helped GreedyGame provide billing services in Indian rupees and provides ongoing assistance in validating business cases for the use of Google Cloud products.

“Our audience is largely gamers and they are very sensitive about the advertising they are looking at,”

Verma says. “So it’s our responsibility to ensure advertisements do not impede the game environment or breach standards around violence, nudity, or gambling.”

GreedyGame also uses [Google Stackdriver](https://cloud.google.com/stackdriver/) (<https://cloud.google.com/stackdriver/>) to provide monitoring, logging, and diagnostics for its advertising network. “We can monitor activities such as where traffic is going and which virtual machines are or aren’t working from a single dashboard,” Verma says. Combined with other Google Cloud products, Google Stackdriver also eliminates the need for GreedyGame to hire infrastructure specialists. “We don’t need an internal team to optimise infrastructure performance,” Verma says.

Advertisement delivery times well ahead of competitors

Thanks to Google Cloud, the average time GreedyGame takes to deliver an advertisement within a mobile game is 500 milliseconds, which is well ahead of the company’s competitors. Furthermore, customers of GreedyGame have not experienced any downtime since the business completed its migration.

“Google Cloud has enabled us to emerge as a lean, efficient mobile game advertising provider with an advertising fill rate of 70%, which is above the industry standard of 50%, due primarily to our lack of downtime,” Verma says.

Virtual machine instance numbers reduced from 200 to 100

GreedyGame can now control its costs despite delivering multiple services from more than 100 virtual machine instances. “One feature Searce revealed to us was the ability to predict usage and cost of every instance we use,” Verma says. “That feature has enabled us to cut our number of instances from 200 to 100 and keep our platform costs very low relative to other advertising networks.” GreedyGame is now accommodating 3 million ad requests per day with no API downtime, while Google Cloud has scaled comfortably to support demand peaks that drive up traffic tenfold.

With high confidence in its platform and product, GreedyGame is now looking at delivering new services to meet the needs of game publishers.
