

Cornershop: delivering groceries on- demand in Latin America

Tell us your challenge. We're here to help.

[Contact us \(/contact\)](#)

In 2015, Cornershop started to become the largest on-demand grocery service in Mexico. Since then, it has become the backbone of its kind in Latin America. To achieve this growth, Cornershop built a mapping platform that would let customers order from their mobile devices via the web, and provided the infrastructure for

"With Google Maps, we've built an on-demand grocery delivery service from scratch, and can deliver orders within 90 minutes. On-demand grocery delivery is new to Latin America, and Google Maps' reliability, useful APIs and familiar interface have helped us build an easy-to-use service that people are

comfortable
with."

Technical Officer,
Cornershop*

Google Maps Platform power every step of Cornershop's ordering and delivery process. Cornershop customers using mobile devices place their orders via apps built with the Maps SDK for Android and the Maps SDK for iOS, while web customers use a site built with the Maps JavaScript API. The APIs display maps, let customers easily select their locations on them, and check the progress of their orders. On the backend, Geocoding API finds customer addresses, and Distance Matrix API calculates estimated delivery times. Drivers use an app built with the Waze API to determine the most efficient delivery routes, which allows Cornershop to deliver orders within 90 minutes.
