[About Computerlogy](#)

With Google Cloud technologies such as Google Kubernetes Engine, BigQuery, and Looker Studio, Computerlogy provides an end-to-end social media and analytics service

About Computerlogy

A business of Future Stream Network (FSN), Computerlogy provides social media management and social media listening and analytics products to businesses in sectors such as telecommunications and banking and finance. Its products and services enable companies to undertake market research, understand user preferences and behaviors, and execute marketing campaigns and strategies. Over its growth from six employees to about 75 employees, Computerlogy has maintained a

in countries such
Thailand, Korea, and

strong technical focus—about 45 of its workers
are developers.

can be
invaluable for
brands.

Businesses
and public
sector
organizations
can identify
trends,
capture
opportunities
to provide
more relevant
products and
experiences,
and address
potential
crises
proactively
and
effectively. In
2009, a group
of software
developers in
Thailand
identified an
opportunity to
provide an
end-to-end
social media
marketing
solution to
corporate
clients and

formed
Computerlogy.

Now a business of Future Stream Network (FSN), [Computerlogy](https://computerlogy.com/) (<https://computerlogy.com/>) provides social media management and social media listening and analytics products to businesses in sectors such as telecommunications and banking and finance. Its products and services enable companies to undertake market research, understand user preferences and behaviors, and execute marketing campaigns and strategies.

Over its growth from six employees to about 75 employees, Computerlogy has maintained a strong technical focus—about 45 of its workers are developers.

**Cloud best opportunity to scale
and develop**

“We believed
Google Cloud
had a brighter
future than our
incumbent cloud
services provider
in delivering
efficiencies in
the way we
provided our
platform and
products to
customers.”

—Vachara Aemavat,
Computerlogy co-founder
and Chief Executive
Officer

When establishing the business, Computerlogy’s founders realized the cloud presented the best opportunity to develop and scale its social monitoring and analytics software. After initially running on one cloud service, Computerlogy conducted an analysis that found the business could realize further cost, scalability, and availability opportunities—and take advantage of advanced data warehousing, analytics, and visualization

technologies—on Google Cloud Platform

(<https://cloud.google.com/>).

“We believed Google Cloud had a brighter future than our incumbent cloud services provider in delivering efficiencies in the way we provided our platform and products to customers,” says Vachara Aemavat, Computerlogy co-founder and Chief Executive Officer. “Its data infrastructure and management technologies—combined with its leadership in AI and machine learning—presented compelling longer-term opportunities for our business.”

Aemavat and his team elected to run the newest version of the organization’s social media management system, SocialEnable, in Google Cloud.

Over a year, Computerlogy re-architected SocialEnable to provide social media analytics its customers could easily integrate into their own environments and make it easy to access on mobile devices and to operate efficiently in Google Cloud.

The business launched the current version of SocialEnable in February 2017 and is running the platform in Google Kubernetes Engine

(<https://cloud.google.com/kubernetes-engine/>) to

manage applications packaged and running in Docker containers, with each container comprising a cluster of Compute Engine

(<https://cloud.google.com/compute/>) virtual machine instances.

An Elasticsearch search engine running in a cluster tracks information from a range of relevant social

media services, including Facebook, Instagram, and Twitter, and bots that crawl the web. Container Registry (<https://cloud.google.com/container-registry/>) enables Computerlogy to control access to its Docker images. The business also uses App Engine (<https://cloud.google.com/appengine/>) to build and develop its applications in a managed, scalable platform—without its developers needing to manage any underlying infrastructure.

Automated scaling

“Google Kubernetes Engine enables us to automate the scaling of our applications and allows us to manage our resources more effectively,” says Aemavat.

Google Cloud seamlessly met all of Computerlogy’s initial requirements while reducing its compute costs by 30 percent. “Google Cloud is convenient, fast and has worked really well for us,” says Aemavat. “We were able to avoid investing considerable capital up front in a data center and

physical equipment such as servers, storage and network which, as a startup, was really important for us.

“We were also able to avoid vendor lock-in, meaning we could choose the cloud services or other products that best fit our business.”

BigQuery enables more relevant analysis

“Our analysis found BigQuery was up to 90 percent less expensive than other databases and data warehouses we evaluated, and Looker Studio provides beautiful, intelligent visualization of reports and analyses.”

—Vachara Aemavat,
Computerlogy co-founder
and Chief Executive
Officer

With SocialEnable running smoothly in Google Cloud, Computerlogy began identifying opportunities to improve the product's relevance and performance to clients. The business reviewed its options and turned to BigQuery (<https://cloud.google.com/bigquery/>) and Looker Studio (<https://marketingplatform.google.com/about/data-studio/>) to provide deeper, more relevant data analysis, reporting, and visualization to clients.

"Our analysis found BigQuery was up to 90 percent less expensive than other databases and data warehouses we evaluated, and Looker Studio provides beautiful, intelligent visualization of reports and analyses," says Aemavat. "In addition, all the data for analysis was already being captured within Google Cloud.

"BigQuery enabled us to provide a platform that could seamlessly analyze social media and integrate the results from other sources, including web data. Finally, BigQuery was simply more practical, more user-friendly and more functional than its competitors.

"We are now providing a BigQuery and Looker Studio-powered, managed software-as-a-service

solution—the BIDA Digital Dashboard—to our customers.” These customers include Thai Public Broadcasting Service (Thai PBS), which uses BIDA to monitor consumer trends and ratings for its productions.

“With
technologies
such as
BigQuery
powering our
product,
businesses and
government
organizations
simply don’t
need an in-
house data
analytics team—
we can extract
data and provide
an analysis
dashboard for
them.

—Vachara Aemavat,
Computerlogy Co-founder

*and Chief Executive
Officer*

With the support of its parent organization and the use of leading-edge technologies such as Google Cloud, Computerlogy is growing at 25 percent year on year, with a surge of business coming from the government and public sector. The business is now taking its compelling proposition international and has just expanded into Korea and Laos.

“With technologies such as BigQuery powering our product, businesses and government organizations simply don’t need in-house data analytics teams—we can extract data and provide analysis dashboards for them,” says Aemavat. “Alternatively, we can allow in-house teams to focus on obtaining deeper, more actionable insights without having to worry about managing the required technologies.”
