

CoRover.ai: Humanizing technology for everyone with multilingual NLP

Get started for free

GOOGLE CLOUD RESULTS

- ✓ Supports 10x the usual traffic load with Google Kubernetes Engine
- ✓ Enables multilingual chatbot capabilities with Vertex AI
- ✓ Assures customers with security and compliance certificates
- ✓ 99% accuracy on AI Virtual Assistant platforms

Supported by Vertex AI, CoRover helps brands reach their customers on a more personalized level by conversing in their native languages with 99% accuracy.

Technology has changed the way we work and play, and for many organizations, provided a level of efficiency that wasn't possible before. However, the

**“Google Cloud
was our provider**

complexities of technology have also created a barrier to entry for people who are less tech savvy. Addressing the need to democratize technology by simplifying access to it, [CoRover AI](#) (CoRover) is on a mission to “make technology more human-like.” With 100+ enterprises, 1 billion+ users across 100+ languages, and 20+ channels, Ankush Sabharwal, CEO and Co-founder of CoRover says that his goal is to make “the human-to-machine interaction to be like a human-to-human interaction.”

**of choice
because of its
ability to scale. It
also has all the
security
certifications in
place which
gives us the
assurance that
our customers’
data is always
kept secure.”**

CoRover

From chatbots and avatars to voice bots for chat platforms, CoRover develops human-centric conversational platforms with generative AI (gen AI) technology. One of its popular products is BharatGPT, a gen AI platform that’s specifically designed for Indian businesses.

BharatGPT functions like any genAI chat platform, but provides customers the flexibility to use it within their own parameters. This means that customers can choose to operate BharatGPT within an enclosed ecosystem so that it taps only onto data that it is provided with. That said, customers can also expand its capabilities to include external data. Being able to customize BharatGPT for users gives brands the confidence in knowing that use of their data is within their control.

Beyond BharatGPT, CoRover also developed products like CoroAssist, which is a genAI-based copilot for enterprises, eSevak, a grievance management system, and AskDISHA, a ticket booking natural language application. With CoRover, customers have been able to improve operational efficiency by 70%, and experienced revenue growth of 10x.

To support the development of its products, CoRover decided to implement [Google Cloud](#), in particular [Vertex AI](#), [Speech-to-Text AI](#), [Text-to-Speech AI](#), [Cloud Translation API](#), and [Natural Language AI](#).

For example, customers using the CoRover platform to build a virtual assistant for their platform can leverage the capabilities of [Gemini](#) as the LLM of choice behind their virtual assistant. With just a few clicks on its platform, businesses can build a personalized bot backed by Gemini, and filter the context of the bots responses as needed.

On the infrastructure side, CoRover relies on Google Cloud solutions like [Cloud GPUs](#), [Compute Engine](#), and [Cloud Storage](#) to manage the unstructured data that comes through its pipelines.

“Google Cloud was our provider of choice because of its ability to scale. It also has all the security certifications in place which gives us the assurance that our customers’ data is always kept secure,” says Ankush.

Providing customers with a secure, customizable LLM platform

When brands implement BharatGPT, they can select if they want to include a GenAI layer to it. They can also select the option to use Gemini to broaden their reach through CoRover’s platform. These options give customers flexibility, while letting them be the gatekeeper of their own information.

Beyond the manual control of data access, the platform itself is built on a Google Cloud. This gives customers an added layer of security. “Google Cloud is approved by India’s Ministry of Electronics and Information Technology, so all of the security certifications and ISO qualifications are in place which makes it easy for us to implement,” says Ankush. The team uses Cloud Storage and [Cloud SQL](#) to manage its databases, and customize its workloads, and taps on Cloud GPUs to support its gen AI capabilities.

“With financial institutions like banks and regulatory bodies as part of our client base, we have a very diverse set of data-conscious clients. Google Cloud helps us provide them with a secure environment,” says Ankush.

Scalability on demand for a seamless user experience

“During peak traffic, we get more than 10 times the usual load, and with the autoscaling capabilities of Google Kubernetes Engine, we can quickly manage the load to avoid bottlenecks.”

Ankush Sabharwal
CEO and Co-founder of
CoRover

One of CoRover’s key clients is the Indian Railway Catering and Tourism Corporation (IRCTC), which supplies train tickets to commuters across India. The high demand for tickets means that a large influx of customers often access the website to purchase tickets the moment they are released. “During peak traffic, we get more than 10 times the usual load, and with the autoscaling capabilities of Google Kubernetes Engine, we can quickly manage the load to avoid bottlenecks,” explains Ankush.

The autoscaling capabilities that Google Cloud provides has also reduced CoRover’s operational cost significantly.

Without any on-premises servers, CoRover is confident that it will continue investing in hyperscalers like Google Cloud. “The security and availability is definitely a good reason for choosing Google Cloud, but I also believe that the opportunity to work together to see where technology can bring us is a big plus point,” says Ankush.

Having built a rapport with the Google Cloud team, Ankush and his team are consistently providing feedback and working together with Google Cloud to innovate and build new solutions.

“Our collaboration with Google is truly something unique as I believe we are truly working together as one team. Even though we

are just a small company in comparison, we have never once felt different when working together. They really made us feel like a part of the team, with mutual trust and respect,” says Ankush.

Improving the user experience to build a genAI-ready future

In a move to democratize its foundational model BharatGPT, CoRover introduced BharatGPT.ai, which allows customers to build next-generation AI applications trained on a dataset of more than two trillion tokens, with a strong focus on Indic languages and reflecting the Indian ethos.

Using BharatGPT.ai, chatbots are easily scalable and leverage the genAI technology of BharatGPT to answer various business questions across multiple domains. It can also conduct specific actions automatically with machine learning capabilities.

With plans to become a top conversational platform, both in India and globally, CoRover is keen to build a long-term engagement with Google Cloud, particularly after seeing close to 99 percent accuracy in its conversational AI Virtual Assistant platforms. Ankush says, “We are deeply integrated with Google Cloud

“With data, we want to be able to anticipate our customers’ wants and needs, and provide them with the right information and advice even before they ask.

This is something I believe we can work together with Google Cloud as we innovate together and build genAI solutions for the future.”

Ankush Sabharwal

tools on our infrastructure side, and as we work towards becoming a top AI platform, we would like to engage on a more strategic level.”

CoRover

While CoRover is now focused on delivery solutions to customers, it already has plans to get one step ahead. “With data, we want to be able to anticipate our customers’ wants and needs, and provide them with the right information and advice even before they ask,” says Ankush. “This is something I believe we can work together with Google Cloud as we innovate together and build genAI solutions for the future.”

CoRover AI (CoRover) is a human-centric conversational platform driven by generative AI technology. With the capability to converse in more than 100 languages across text and voice platforms, its applications are used across various industries, including banking, finance, healthcare, and manufacturing, and ecommerce, supporting customers in their native language.
