

Temus: The Future of Talent Acquisition and Development with AI

Get started for free

GOOGLE CLOUD RESULTS

- ✓ Equips itself to increase productivity by 10%
- ✓ Reduces resume processing time by 90%
- ✓ Positioned business to cut \$1M from resume processing
- ✓ Improves the quality of recruitment candidates
- ✓ Minimizes duplication in recruitment processes

With Google Cloud AI, Temus is transforming its talent acquisition and development processes to improve its people, streamline processes and reduce costs

Established in 2021, [Temus](#) aims to accelerate the digital transformation of enterprises and public sector organizations in Singapore and beyond.

And it's succeeding. Since its foundation, the subsidiary of Singapore-headquartered investment company Temasek Holdings has grown to over 500 employees, established offices in India, Vietnam and the Czech Republic, and won clients in markets as far afield as the United States.

"We work with companies to close the consulting-execution gap in digital transformation by incorporating complementary consulting and implementation practices," said John Ang, Associate Director, Temus. Today, the business operates four centers of excellence, covering strategy and design; digital and process transformation; technology implementation; and AI and data.

Driving internal and external improvements with AI expertise

Understanding the transformative potential and value of AI to business and government, Temus elected to lean into the technology. "We wanted to become experts in AI and suffuse it into everything we did and proposed as an organization," said Ang. This prompted the business to start internal projects to determine how AI

"We wanted to optimize across cost, ease of use and developer experience, and Google Cloud's AI services were a real point of differentiation."

could improve the efficiency of internal processes across human resources, finance and other back office functions. These projects would enable Temus to realize some of the digital transformation gains the business provides for its clients.

Temus

Google Cloud's combination of proven infrastructure services and rich AI capabilities prompted the business to add the provider to its technology stack. "We wanted to optimize across cost, ease of use and developer experience, and Google Cloud's AI services were a real point of differentiation," said Ang.

Turning to a one-stop AI shop

"Gemini stood toe-to-toe on output with the most-used LLMs in the market, and was very natural in the way it ingested prompts to produce high quality results with no hallucinations."

Based on engineers' feedback and a broader business evaluation, Temus elected to base its AI strategy on [Vertex AI](#) and [Gemini Pro](#). Ang describes Vertex AI as a 'one stop shop' for housing and organizing of Google Cloud AI and lauds the cloud provider's commitment to constantly refining Gemini and optimizing it for three different sizes.

"Overall, Google Cloud's AI services had a better cost to feature-set to developer experience ratio than the alternatives," said Ang. "There

John Ang
Associate Director,
Temus

was a 40% cost advantage in using Vertex AI with Gemini Pro 1.5 over the alternatives, which was very attractive for high volume but low value workloads such as document or text reviews where you wanted to keep the per-task cost as low as possible.”

Temus also evaluated Gemini against other prominent LLMs for its ability to read different types of document and text, ingest certain prompts and deliver high quality outputs. “Gemini stood toe-to-toe on output with the most-used LLMs in the market, and was very natural in the way it ingested prompts to produce high quality results with no hallucinations,” said Ang.

The business’s engineers also marked Google Cloud highly for the ease with which they could spin up resources and services, create accounts and work out its APIs, which translated to significant efficiency gains.

Enhancing talent acquisition and development

Temus’ two primary current AI use cases involve talent acquisition and talent development. “For talent acquisition, we wanted to transform our hiring process and initially we focused on using AI to score job candidates and create a ranking list,” said Ang. “However, we realized this did not fit how hiring managers were making decisions, which was based on the favoring of particular characteristics, such as skills or seniority levels, at certain points in time.”

The business’s second iteration moved away from a quantitative approach to lean into generative AI’s unique capability of sorting and making sense of unstructured text information in resumes. “We began asking AI to summarize a candidate’s experience in three sentences, and the outcomes helped hiring managers prioritize as required,” explained Ang. “Now those managers drop resumes straight into our talent acquisition system to extract key

information. Across 50-odd resumes, we have been able to reduce a review process that took three to four hours to just 10 minutes.”

This process has also helped Temus target the best candidates more effectively and drive up the quality of hires.

“With Gemini and Vertex AI, we have the monetary value of the time saved, better quality recruitment and the improved engagement of hiring managers who, instead of going through the motions, are searching for the right candidate and going in to bat for them,” said Ang.

Reducing resume processing time and resource requirements

He believes the system will initially reduce manpower costs by \$1 million-plus, based on a 90% reduction in resume processing time. This dollar figure is expected to rise as the business grows. The new system will also deliver considerable benefits to applicants for roles at Temus. Ang explains: “In the past, we would open a role, look at resumes, fill the role, and forget about the others who applied. A similar role may open up perhaps four months later and we would start the process again.”

“With our new system, the information provided by everyone who applies for a role is already captured, analyzed and organized. The next time I need to fill a similar role, I have an existing pool of candidates. We are now putting in place processes whereby we stay in touch with candidates because they may have skills more relevant to another role, or upgraded their certifications or accreditations.”

Dramatic improvements anticipated in performance and productivity

On the talent development side, the business is acutely conscious of the benefits of increasing the performance and productivity of its 500-strong existing workforce by 10%. “That’s the equivalent of hosting another 50 people,” said Ang.

To develop the first iteration of its AI talent development system, Temus asked its employees to list their skillsets across all the projects they had worked on as part of a data gathering exercise. The business then stored that data to be accessible to generative AI. Its next step was to ingest a repository of approved learning material coded for different roles, including data engineering, design and consulting.

“Our talent development engine uses these two data sources to recommend material our people can use to move to the next level,” said Ang. “Where we ingest the data, we summarize this material and notes provided by people who have gone through the same process to deliver a living knowledge repository”. With an LLM layered on top and the right prompts, Temus’ people are guided through the process, with the system recording all of these actions. “Our managers can pick up this information and form teams from there, while our employees can step up their skills development,” shared Ang.

Ang has enjoyed working with the Google Cloud team on Temus’ AI projects. “Google Cloud is not afraid to be on the bleeding edge of technology and enables businesses like ours to play with new products and services with support from the pre-sales engineers,” he said. “The AI wave has barely gotten started and we’re looking forward to what is to come on the Google Cloud.”

“The AI wave has barely gotten started and we’re looking forward to what is to come on the Google Cloud.”

John Ang

Associate Director,
Temus

Temus was established by Temasek in partnership with UST, to provide digital transformation solutions for the private and

public sectors as we aspire to be a strategic partner in realising the Singapore Government’s Smart Nation vision. We are headquartered in Singapore and have more than 500 employees across a wide range of disciplines in strategy, design, architecture, technology, data & AI.
